Ambition

Dutch Seveso companies will be the safest in the world by 2030, hold an internationally valued and recognised **leading** position in the development and *implementation* of safety concepts related to the handling of hazardous substances.

Example 1: joint learning from safety performance data and regulatory inspection data

SAFETY DELTA NEDERLAND

How safe are we? Serious incidents Dutch Seveso companies (~400) reportable under Seveso III Directive

in Safety

Pilot Performance Indicators

Improvements in data collection and analysis across the sector

Goal: further improvements in personal and process safety for companies dealing with hazardous substances and that are subject to Seveso regulations.

How:

- 1. Identify improvement opportunities through systematic, consistent review of data for industry segments.
- 2. Share knowledge and available tools to support the implementation of jointly agreed improvement programs.

Example DCT output

Sector – all

Parameter: violations Categorie 3 (=very limited threat of a serious incident)

All Dutch Seveso companies, by industry segment

public information

Years: 2019, 2020, 2021, 2022

Pilot Performance Indicators Improvements in data collection and analysis for the sector

Challenges

- 1. Fear of unforeseen consequences when sharing data
- 2. Poor data quality
 - limited data recording in some industry segments

 - description of findings in regulatory inspection reports

use of different definitions for safety performance indicators

Projects

in Safety

Find, connect, innovate in safety

Example 2: tools for self-assurance

SAFETY Delta Nederland

Summary

Self-Assessment Questionnaire are your controls in place?

Goal: Further improvements in personal and process safety for companies dealing with hazardous substances and that are subject to Seveso regulations.

How:

- 1. companies do integral, systematic self-assessment of their
 - safety management system,
 - safety culture, and
 - technical installations
- 2. make use of the simple tools provided to develop a wellprioritised safety improvement plan, and
- 3. monitor its implementation.

Challenges

Self-Assessment Questionnaire (SAQ) are your controls in place?

- 1. Motivating companies to deploy this tool (or an equivalent methodology) in an environment of competing priorities
- 2. Gaining trust between parties for sharing information about 'pain points' and lessons learned on how to effectively implement risk controls

Projects

in Safety

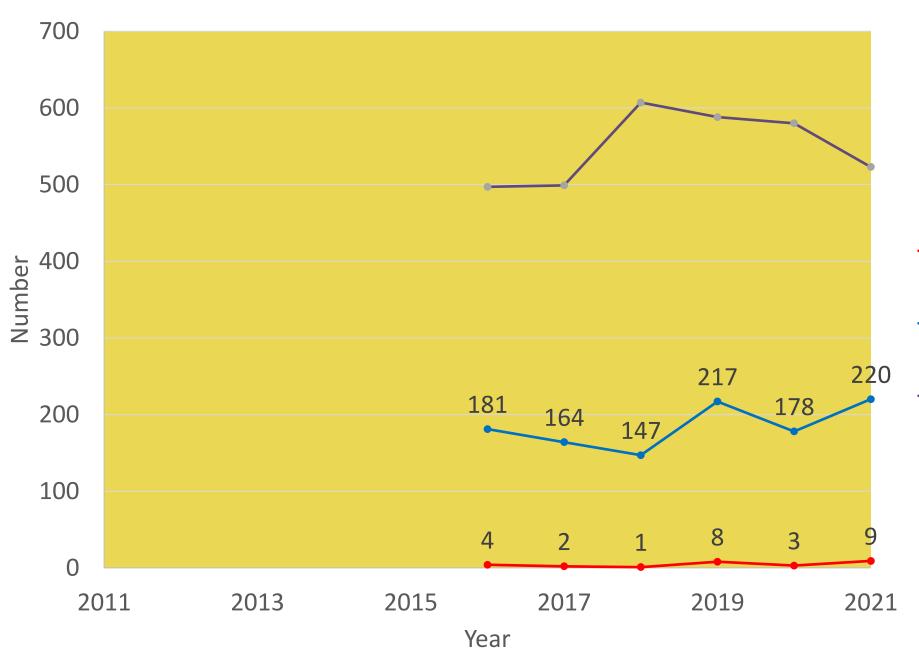

Find, connect, innovate in safety

Example 3: exploring new ways of doing regulatory inspection at mature, high performing companies

SAFETY DELTA NEDERLAND

Non-compliance with regulations - annual inspection of about 380 Dutch Seveso companies

- catagory 1 immediate threat of serious incident
- --catagory 2 no immediate threat of serious incident
- --catagory 3 very limited threat of serious incident

Summary

Regulatory inspection towards an assurance model

Goal: make a company accountable for delivering good safety performance (=outcome) and not just for managing risks well enough (=system). Stimulate this by a more effective and efficient way of regulatory inspection.

How: Introducing the concept of a 'control framework' with clear roles for the company and regulatory inspection:

- 1. addition to the current 'static' safety management system, 2. focus on the material risks, and
- 3. requires continuous evidence so that with a high degree of certainty it can be confirmed that control measures for managing these material risks are suitable and effective.

Challenges

Regulatory inspection towards an assurance model

We deal with 'criminal' organisations who deliberately try to break the law and will hide things.

We check them in great detail once or twice a year (=**photo**).

We will catch them out and fine them!

??

Two extreme belief sets...

Approach:

- 1) develop methodology to **strengthen** a company's **internal oversight**
- company

We deal with 'gentleman' organisations, where sometimes things go wrong, despite their strong risk oversight. We continuously have access to their information (=film) and jointly demonstrate with high degree of certainty that safety risks are effectively managed. We have a joint opinion on safety performance.

explore a different **relationship model** between regulatory inspection and

Find, connect, innovate in safety

Example 4: the use of Artificial Intelligence for systematically picking up weak signals from operator reports and other 'big data' to prevent incidents taking place

looking back and explain to looking forward and prevent from (learning from incidents) (learning from information)

SAFETY DELTA **N**EDERLAND

Idea

Learning from information using big data and AI

... there is too much data. It is impossible for a human being to keep track of it.

... "Accidents do not occur in a chaotic fashion. Underlying patterns and trends do exist and can be captured", Sarkar et al. 2019

... experiment with the application of Artificial Intelligence (AI) and Natural Language Processing (NLP) to detect patterns and trends faster and better

... learn how to use this to prevent incidents

Learning from information using big data and AI

Technical Sentiment Analysis

- Carried out an industrial scale pilot, using shift reports Developed a Safety lexicon, with about 400 technical terms
- related to process safety
- Gave every term a polarity (0 to 5, positive or negative) based on expert opinion
- Used amplifiers ('a lot', 'many') and negators ('none', 'no'. 'doesn't')
- Called it Technical Sentiment Analysis (TSA)

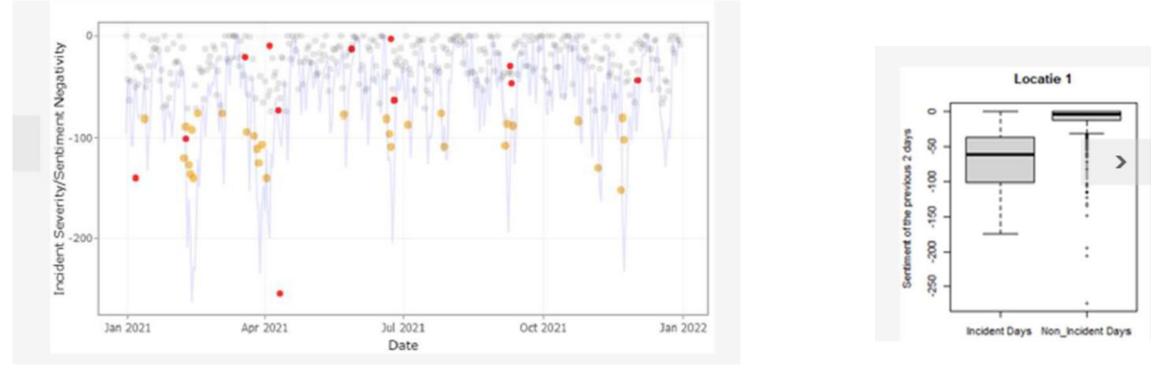

TSA provides an absolute score of the 'sentiment' of a shift report and allows trending.

Learning from information using big data and AI

Technical Sentiment becomes more negative in the days prior to an incident →demonstrated the potential of **TSA** as a **predictive tool**

Grey:	TSA score of shift report
Yellow:	shift report with high TSA score
Red:	TSA score on the day of the incident
Line:	sum of TS scores prior to an incident

Next: research into combining different 'features' involving different companies in different industry segments

Result

Lower sentiment prior to incidents

in Safety

Needed for achieving the SDN ambition

- of risk controls and the resulting safety performance
- 2. 'deserved' mutual trust between companies and regulatory inspection
- 3. safe space for experimenting

1. strong company internal oversight of safety risks, the state
